

REPORT

Learning the basics to develop web pages using HTML, CSS, JS, Gitgub and other technologies is essential for professionals in Library and Information Technology. Libraries are hubs of information and each day depend on technology to strive and communicate effectively with their clients.

The content of the Internet Applications classes demonstrated that it is possible to improve the information system of a library and therefore provide improved service experience to customers.

Using HTML, CSS, JS, Gitgub can help create and maintain computerized systems in a library. These tools are used to build websites or simply update information about the latest library programs or activities. Through the use of these tools library staff can perform duties in archive, records management or information setting. In addition, it would be wise to develop a program aimed at youth to introduce them to some of the basics of webpage development.

Overall, having these skills and knowledge contribute to the client facing technology that libraries use to engage with the public.
